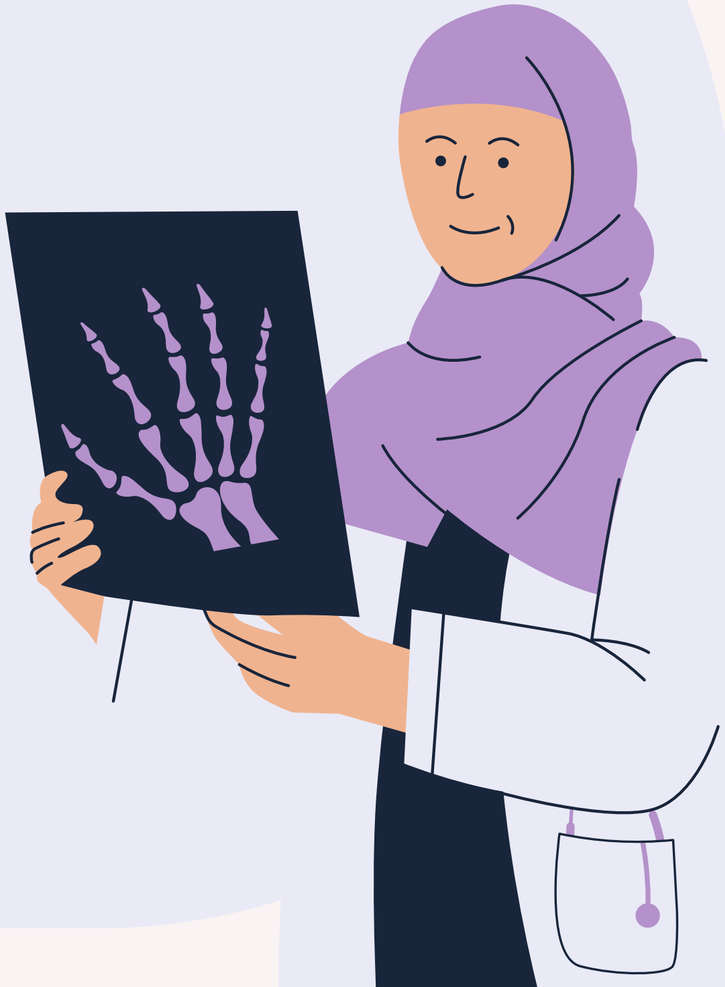
HealthScope

Detect. Predict. Prevent.

Problem Statement

- Most people ignore early symptoms of disease due to lack of continuous monitoring.
- Access to healthcare is limited in rural/underserved regions.
- Manual health tracking is often inconsistent or ignored.
- Stress, burnout, and sedentary lifestyle-related issues are rising.



Proposed Solution

An AI-powered mobile app that:

- Tracks daily activity using phone sensors
- Monitors eye movement & facial patterns using the camera
- Uses AI to predict risk of common lifestyle diseases
- Suggests personalized, preventive health actions

Key Features

Activity Recognition

Detects physical inactivity and irregular movements. Identifies stress indicators from sensor data. Offers insights into daily routines.

Eye & Face Monitoring

Monitors eye strain and blink rates. Detects fatigue and screen time effects. Provides real-time visual feedback.

Habit Tracking

Logs sleep patterns, water intake, and screen time. Encourages healthier daily routines. Facilitates consistent self-monitoring.

Risk Analysis & Advice

AI provides real-time health advice. Analyzes risks and offers personalized suggestions. Guides users toward better health.

Technical Stack

- React Native
- Android SensorManager
- TensorFlow Lite + Camera

- Firebase Firestore
- React Native Push
